

# Turning AI-generated language into care-ready policy.

**NTRACTS** 

**In healthcare, policy  
must do more than  
sound compliant. It  
must work in practice.**

Artificial intelligence can produce policy language almost instantly. Ensuring that language reflects real-world clinical practice is another matter entirely.

But healthcare policy does more than document requirements. It guides real-world decisions that affect patient safety, regulatory compliance and organizational risk.

That's where Ntracts RN expertise makes the difference. Our nurse-informed approach refines AI-generated drafts into policies grounded in real workflows, regulatory intent and the complexities of patient care—saving teams significant time while ensuring policies are both compliant and practical.

# Where AI efficiency meets Ntracts RN expertise.

A side-by-side look at how clinical insight strengthens AI-generated drafts into operational, defensible healthcare policy.

Scenario	AI Draft	AI Output Enhanced by Ntracts RN Expertise	Real-World Impact
<b>Behavioral health de-escalation.</b>	"Staff should respond to agitated patients using de-escalation techniques."	"Staff shall perform an immediate safety assessment for any agitated patient, initiate trauma-informed de-escalation using the facility's behavioral response protocol, document all interventions and patient response and escalate to clinical leadership if risk increases or safety cannot be maintained."	AI offers general intent. <b>RN-informed policy provides actionable steps that protect patients, staff and the organization.</b>
<b>Ambulatory medication reconciliation</b>	"Medication reconciliation must be completed at each patient visit."	"The RN shall complete medication reconciliation upon admission, documenting a comprehensive list of the patient's current medications, including name, dose, route, frequency, and purpose. The managing provider will review the list, resolve and document discrepancies, and ensure any changes are entered by the attending physician or licensed practitioner."	AI states the requirement. <b>RN guidance defines ownership, timing and documentation to reduce preventable errors.</b>
<b>Infection prevention in long-term care</b>	"Facilities must follow infection control standards."	"Nursing staff shall implement hand hygiene audits, initiate transmission-based precautions when indicated, complete environmental cleaning checklists and review infection data weekly with leadership."	AI references standards. <b>RN-informed policy operationalizes prevention in real resident care environments.</b>
<b>Telehealth triage</b>	"Telehealth triage should be used when appropriate."	"Nurses conducting telehealth triage shall use standardized assessment criteria, identify red-flag symptoms requiring in-person evaluation, document findings in the patient record and coordinate follow scheduling."	AI reflects a trend. <b>RN-informed policy safeguards hybrid care.</b>

**Built on the legacy of MCN Solutions,** Ntracts delivers policy solutions developed with RN expertise at the core, helping healthcare organizations of every size strengthen compliance, reduce risk and support safe care delivery.
